

Goblin Scheduler User Manual

A practical guide for players and admins

What The Bot Does

Goblin Scheduler helps organize DnD sessions by collecting player availability, helping admins choose session dates, creating Discord server events, sending reminders, tracking recap duty, and adding a healthy amount of calendar nonsense.

Player Commands

/profile

Shows your DnD player profile. If you are not registered yet, the bot shows a registration button. A profile contains nickname, race, and class. You can edit your profile from the profile view.

/excuse

Generates a totally valid fake reason why someone is unavailable. The response is visible to everyone.

/fight opponent:@user

Starts a fake battle between you and another user. The bot randomly declares a winner. The response is visible to everyone.

/spell

Casts a random ridiculous spell. The response is visible to everyone.

/curse target:@user

Curses someone lightly with a harmless DnD-flavored inconvenience. The response is visible to everyone.

Availability System

When an admin starts planning, registered players receive a DM with a button to enter availability. Players can also use the public planning message in the server. Only registered players can enter availability.

Availability Options

- Unset: no answer yet
- Available: you can play
- Doubtful: maybe, but not guaranteed
- Unavailable: you cannot play

Available Time Slots

- Monday 20h

- Tuesday 20h
- Wednesday 20h
- Thursday 20h
- Friday 20h
- Saturday 14h
- Saturday 20h
- Sunday 14h
- Sunday 20h

Notes

Players can add one note per planning week. If planning is open for two weeks, each week has its own separate note.

Deadlines

Each planning week has its own deadline. After the deadline passes, players cannot modify availability or notes for that week anymore.

Reminders

If a player has missing availability, the bot sends a reminder at 10:00. If a session is planned, the bot sends a reminder the day before the session.

Admin Commands

/start_planning

Starts a new planning cycle. The admin chooses the deadline for the first target week, chooses whether to plan only next week or also the week after, and if needed chooses a separate deadline for the second target week. Players are then invited to enter availability.

/availabilities

Shows the current planning summary. If multiple weeks are being planned, the admin first chooses which week to display. The summary shows registered players, deadline, sure dates, probable dates, each player availability, notes, selected sessions, and recap player if already chosen.

Choosing Session Dates

After viewing availabilities, the admin can select up to two sessions for the chosen week. Sure dates mean everyone is available. Probable dates mean everyone is either available or doubtful.

Recap Duty

After choosing session dates, the admin chooses who will recap the previous session. The bot displays the recap order: Sonia -> Shin -> Atouf -> Balico. It also shows who did the last recap.

The chosen recap player is included in player DM announcements, the server announcement, day-before reminders, and the admin summary.

No Session Option

The admin can choose No session on chosen week. When selected, previous sessions for that week are cleared, created Discord events for that week are deleted, players are notified, and the admin summary remembers that no session was selected.

Discord Events

When sessions are planned, the bot creates Discord server events and posts links to them in the server channel. Event cover images are randomly picked from the event cover image folder. When two sessions are created, the bot tries to use different images.

DMs

The bot sends DMs for planning invitations, missing availability reminders, session announcements, no-session announcements, and day-before reminders. If someone does not receive DMs, they may need to allow DMs from server members in Discord privacy settings.

Required Bot Permissions

- Send Messages
- Use Slash Commands
- Embed Links
- Create Events
- Manage Events

Admin Notes

Planning and cancelling sessions should be done from the Discord server, not from a DM, because server events require server context.
